SUMMARY

Full-stack engineer working in TypeScript, Node.js, PHP/Laravel, PostgreSQL, and AWS, with SvelteKit and React on the front end. Since 2023 I've been the lead engineer on systems people use every day: a nonprofit's donation and analytics platform, a client's production-floor ERP, and B2B SaaS. Looking for a full-time role on a product team.

EXPERIENCE

Software Engineer, Emmabyte Engineering, Inc. *(independent)* **Sep 2025 – Present**

- Lead engineer on a client's core ERP (Laravel, PostgreSQL), used daily by every staff member of a 20–50 person company, including on the production floor. Took over its migration from CakePHP to Laravel and built CI/CD with a staging server and an R&D sandbox seeded with generated data.
- Pre-launch: building Harbor, a multi-tenant case-management SaaS for California disability-services providers, built to be HIPAA-compliant on AWS with PostgreSQL row-level security, per-tenant encryption keys, and an audit trail.
- Built and run emmabyte.io, the company ERP. Clients see invoices, tasks, and retainer hours and file support tickets; staff get a custom CRM, a retainer-hours dashboard, WYSIWYG page and blog editors, a hiring pipeline, team management, and automated reports and invoices with Mercury billing.
- On retainer for Haven Ministries (former employer): added podcast feed hosting and validation with an audio pipeline on Cloudflare R2, server-side auth for a listenership service, incident post-mortems, and CI checks on its docs.
- Use AI coding agents (Claude Code) for much of the implementation: I own architecture, security-sensitive code, test design, and review; patient data and secrets stay out of prompts; Harbor PRs run 1,000+ tests and security scans.

Haven Ministries **Nov 2016 – Sep 2025**

Software Developer *Nov 2023 – Sep 2025*

- Built Haven Bridge (SvelteKit, Supabase, Prisma), the internal platform staff use daily: it merges iDonate, Shopify, and WordPress webhooks into real-time analytics dashboards, ending 2–4 days a month of missed donation data, and runs music management with Playwright-driven lookup of external IDs.
- Sole in-house engineer at a 20-person nonprofit. Planned a three-phase modernization and delivered the first two, including embedded iDonate giving and a Shopify store that separates buyers from donors.
- Moved four WordPress sites off a single self-managed VPS onto auto-scaling managed hosting, refactored theme code into plugins, replaced a direct MySQL link to the CRM with an API, and added uptime monitoring.

IT & Analytics Advisor *Nov 2016 – Oct 2023*

- Grew from IT and analytics into engineering: built a Python/Prefect ETL pipeline from the 4D CRM into PostgreSQL for Metabase and Tableau, and containerized the WordPress development environment with Docker.

Software Engineer II, SpaceX **Oct 2023 – Nov 2023**

- Software Infrastructure team: built a C# CLI tool that scripted dev-environment setup for a backend monolith.

PROJECTS

Tarot Tutor (tarottutor.io) **2026**

- Designed and built a Brilliant-style learning platform for tarot with game-style interactive lessons across all 78 cards, a free no-signup first lesson, and Pro plans billed through Stripe. SvelteKit, Supabase, PostHog; 2,000+ tests.

Study Stack (github.com/emmabyte/study-stack) **Nov 2022 – Jan 2025**

- Co-founded and led engineering on an online learning platform (SvelteKit, TypeScript, Prisma, Stripe); wrote most of the code myself, mentored an intern, and open-sourced it.

SKILLS

Languages: TypeScript, JavaScript, PHP, Python, SQL, Go
Frontend: SvelteKit, React, Next.js, Tailwind CSS, accessibility (WCAG 2.2, axe)
Backend & data: Node.js, Laravel, PostgreSQL, Supabase, PlanetScale (MySQL), Prisma, Drizzle, REST APIs, Stripe
Infrastructure & tools: Docker, GitHub Actions (CI/CD), AWS, OpenTofu/Terraform, Vercel, Playwright, Vitest

EDUCATION

B.S. Computational Mathematics, University of California, Riverside **May 2022**
Summa Cum Laude, GPA 3.97. Core coursework shared with the Computer Science B.S.
